### EviPrime Debut

Hannover, Germany – March 3, 2009 -- In March 2009, Secure 1<sup>st</sup> debut internationally its long awaited first fully-in-house- developed product, EviPrime<sup>®</sup>, at CeB IT 2009 - the world's largest and most renowned trade fair in the IT and Telecom industry in Hannover, Germany. EviPrime<sup>®</sup> has been designed to help the investigators and the law enforcements to speed up the investigation process, to save the number of human resources involved in the process, and ultimately to reduce the total cost of the process during course of the investigation.

Secure 1<sup>st</sup> research and development unit initiated its research more than two years ago by investigating the systematic approach that Microsoft's operating systems and computer software applications keep and store those parts of computer data which can be used as digital evidence in certain locations in the form of computer files and folders in a storage device such as hard disk. The research findings led to the development EviPrime<sup>®</sup>. By automatically accessing all relevant locations, EviPrime<sup>®</sup> user is able to promptly search, extract and store possible evidence for further analysis. EviPrime<sup>®</sup>, with its patented<sup>i</sup> methodology, creates a unique platform to extract vital data from the examine computer. This automated approach reduces the duration of logical evidence extraction process and produces more reliable results compare to other methods.

The application saves and stores the secured evidence base on the user accounts and the ownership. This approach gives a fast and reliable access to the evidence which is related to the account which is under investigation. In order to assure the maximum file integrity, the application categorizes possible evidence in a separate folder based on the nature of the evidence and produces a report with MD5 checksums for each file. In addition, EviPrime<sup>®</sup> provides the investigator with the valuable information about the computer, network configuration and the running applications as well as the open ports to secure as much evidence as possible.
