

EviPrime® is an advanced forensic tool for evidence acquisition from computers using Microsoft Windows operating system. **EviPrime®** scans a computer for all possible evidence and sorts the findings in a categorical order for future investigation.

Highlights

- Plug & Play Device
- Efficient investigation
- Efficient evidence acquisition
- Reliable data duplication
- Smart evidence categorization
- Investigation with integrity (MD5 Hash, SHA1 Hash)
- Evidence ownership identification
- Forensic report generation

New Features

- Source Drive Lock
- Increase in speed of evidence acquisition
- System Information Debug for Windows XP Home Edition
- STOP & Resume Buttons
- The produced report is more organize

Cyber Forensic Investigation Process

Learn More

Microsoft's operating systems and computer software applications keep and store those parts of computer data which can be used as digital evidence in certain locations in the form of computer files and folders in a storage device such as hard disk. By automatically accessing such locations EviPrime® user is able to promptly search, extract and store possible evidence for further analysis. EviPrime®, with its patented methodology, creates a unique platform to extract vital data from the examine computer. This automated approach reduces the duration of logical evidence extraction process and produces more reliable results compare to other methods.

EviPrime® has been designed to help the investigators and the law enforcements to speed up the Investigation process, to save the number of human resources involved in the process, and ultimately to reduce the total cost of the process during course of the investigation.

The application saves and stores the secured evidence base on the user accounts and the ownership. This approach gives a fast and reliable access to the evidence which is related to the account which is under investigation. In order to assure the maximum file integrity, the application categorizes possible evidence in a separate folder based on the nature of the evidence and produces a report with MD5 checksums for each file. In addition, EviPrime® provides the investigator with the valuable information about the computer, network configuration and the running applications as well as the open ports to secure as much evidence as possible.
